Ridgeway grandfather clock pendulum stops

Listed on the following page are some suggestions you might want to try yourself before calling the clock repair. We've included pictures of grandfather's hours and the names of the sections to help you out. If you have any additional questions, please contact us and we may be able to guide you through your problems and get your grandfather hours and walk. The pendulum won't swing. There are many times the grandfather's hour pendulum will look like it's swinging okay; However, if the grandfather's clock does not properly run the pendulum will eventually stop, usually in 10 to 20 minutes. Here are some things you might want to try yourself out before calling the repair hours.1. First, make sure your grandfather's hour weight has been pulled. This may sound silly; However, I always ask this question and some times customers don't realize this, and they don't know how to do it. It may sound foolish to some people, but if you're not told how, then you won't know how. Also check to see if the weight is rented properly. Most hours (not all but most) weights are different in weight, usually on a modern day a heavier weight clock grandfather occurs on the right as you face the clock.2. Does the grandfather watch touch each other? Touching a guaranteed hand to stop your grandfather's hours! Look at the clock and minute hands carefully to see if they are touching. To repair it, push the watch hand a little towards the dial to clean the minute's hand (but make sure it does not touch the dial)! If they are still touching, you can bend the hands of a little minute towards you, allowing for release. If you have a second hand, make sure it is not pushed too close and touch the dial. The second hand is very sensitive and a bit of resistance will stop the clock. If this is the case, the second hand pull is just a pinch to allow it to turn free.3. Make sure the grandfather's clock is on the level. A few hours older grandfathers would run well slightly out of level when the movement was adjusted. This is not true for newer grandfather hours. The newer grandfather clock needs to be level for both front-to-back and side to side.4. Does the grandfather's watch hand touch the dial glass? If the minutes on the grandfather's clock touch the front glass, this will stop the clock from working. To fix this problem, a little bends the hands from the glass, but be careful not to bend it too much and allow it to touch the watch's hands. There is a very fragile part in grandfather's hours that the pendulum hangs on. This section is called spring suspension. I've included typical one pictures (some grandfather's hourly suspension springs may vary by size and shape). If spring suspension bend too much or if it breaks, the pendulum will not continue to swing. You may notice when a pendulum swing, it will make a circle or a diagram 8 pattern. This is an indication that the suspension needs to be replaced. Sometimes you may find part of this spring suspension at the bottom of the grandfather's clock case. If this is the case, then spring suspension should be replaced and it is recommended that qualified hours technicians do this work. The video on your right will explain how to adjust the speed of your grandfather's hours. It is the same for all hours driven by the pendulum. Just remember to adjust the beans in small increases. A quarter turn at a time will be a lot. You will eventually be able to clock to take care of the excellent time. As always if you keep having trouble, you are welcome to contact us for additional information. Heavy Refuse To Drop Grandfather's Hours gained his power from weight. Some grandfather's hours have 2 weights; However, most of the newer grandfather hours have 3 weights. For the purposes of this article, I will discuss the hours of 3 weight loss grandfathers. Usually the weight on the right handles the chimes on grandfather's clock and weight on the left handles the clock strike and the central weight handles the time. At every swing of the pendulum, the weight of the pendulum falls slightly. When the minute hand reaches the quarter clock, the clocks the chimes, and the weight of the right hand falls. And finally, at the top of the clock, the chimes play, the weight of the right hand falls slightly, then the lever is cut, the clock strikes the right clock, causing the left weight to fall. Usually all 3 weights will fall the same (inches or more) if the grandfather's hours operate properly. Some models of grandfather hours have a silent or afternoon switch on them. By turning on the silent or afternoon switch, the left and right weight will remain rotating during the dead period. In most cases, if there is no evening switch or silence, or the evening switch or silence is in position and the weight still does not fall, then it is likely that the clock needs to be urged. The slightest amount of dirt or lack of oil is the main cause of this problem and the movement needs to be removed and acryched properly to get clocked and running again. The little trick you might want to try (however, it won't permanently fix the problem), is that while a little bit pulls the right weight with one hand (with gloves of course) and turns on the minute's hands with your other hands either 1/4, 1/2 or 3/4 hours, chimes may start working for a short time. Again this is not a permanent repair; However, it will allow you to see if the clock will start working again. If the pendulum swings properly then the weight of the center will fall properly. Jam Chimes is out of the Sink. Again, for the purpose of this article, I will discuss the grandfather's hours with Westminster chime. A few newer hours came with a selection of several songs; However, Westminster songs are the most popular. Grandfather clock with Westminster song, if working with will play play Note in this order: On 1/4 passing each hour you will hear 4 notes. At 1/2 pass every hour you will usually hear 8 notes 3/4 passing the hour you will usually hear 12 notes On hours (before hearing the number of chimed hours), you will usually hear 16 notes. Many times chiming will come out of the sequence for many reasons. If you've just adjusted the time and the chiming is running out of message, just allow the clock to chase itself. By allowing hours to walk for one or 2 hours, the grandfather's hours will chase himself and chiming will return to the message. If you have allowed the Grandfather's clock to walk for a few hours and it does not chase himself, then the minute hand is in the wrong position. Follow these steps to fix it:1. Move the hand 15 minutes at a time until the grandfather clocks the chimes the clock. Then stop. Don't worry where the minute hands are pointing at the moment.2. Leaving the hands minutes in this position, disinfering the beans holding hands in place.3. Remove the hand minutes.4. Re-position the minute's hand so that it points to the clock.5. Reinstall the beans holding the hands of minutes. Minute hands have a square hole in the base that allows you to put a hand on a square acre. Minute hands can be installed in one of 4 positions; However, only one position is correct. Strike Clock out of Sink If hours your grandfather strikes the wrong hours, this is usually a quick fix and will only take time to repair. WATCH HANDS can ONLY be moved forward or backward without any problems. If the clock strikes the wrong clock, you can simply twist the watch either side of the clock that's right the clock is cool. Here's an example. Keep in mind your watch or hand position may vary. EXAMPLE: Grandfather clock draws 12 times; However, the clock reads 9 O'clock. 1 After hours the grandfather stopped soothing 12, slowly understood the WATCH alone and moved it either to position 12. Use caution here and make sure you don't move the minute's hand or bend either WATCH HAND or minute.2 hands Using your thumb on your thumb, slowly press the CLOCK hand down a little bit. Be careful and do not press so hard that the WATCH touches the watch face.3 Hours grandfather strike now should return is a sequence. Cleaning and maintenance of grandfather clocks really needs little care and maintenance. Listed below are some of the steps you can take to maintain your Grandfather's hourly quality:1 Windy hours your Grandfather every 7 days.2 Make sure the door is locked if possible.3 Candles and polish your watch cabinet as often as you do your other furniture. Use non-silicon liquids or paste caps.4 Avoid revealing your grandfather's hours to steer clear of sunlight and protect your grandfather's clock from extremes and moisture changes. Prolonged exposure to direct sunlight can fade finishing while temperatures are extreme and Changes can lead to split wood cases or crack.5 Check periodically to ensure your grandfather's clock rests firmly at all four levels. This is especially important if you plan to keep your grandfather's hours on the carpet. For the first few months, the grandfather's clock legs will settle into the carpet and become dismal. Adjustments to any of the 4 stages may be required.6 Check the weight (with your gloves) to ensure that they are still tightly installed. It is recommended that your hourly movements be silenced every two (2) years from the date of purchase and carefully cleaned each of the five (5) to ten (10) years depending on the weather conditions. Very dry, humid or salty air, heat or cold, may require more frequent service. If you've tried everything you can do to get your grandfather hours and running, and it still won't operate properly, then maybe it's time for good cleaning and service. Call us at 678-462-7856 or email us to set up an appointment and we will be happy to come to your home or office and get your grandfather hours and run. We are here to help the Clock Repair Service is one of only a few mayoral hour repair companies in the city coming to your home or office and set up a small shop there in your home and do the following:1 Set up a small shop next to your hours.2 Remove weight grandfather and pendulum.3 Remove the grandfather's hours movement from the case.4 as Criminal Throw and dry the oil in movement.5 Re-Oil and adjust the movement of the grandfather's hours.6 Clean the section in the case of grandfather's hours.7 Reinstall the clock movement grandfather.8 Clean and polish the weight of grandfather and pendulum.7 Reinstall the grandfather's clock.8 Clean and polish the weight of the grandfather's hours and pendulum.9 Re-level of the grandfather's case jam.10 Adjust and Calibrate your grandfather's hours using the most advanced electronic equipment.11 Adjust your grandfather's hourly time and speed.12 Make any additional fine adjustments.13 Clean and polish the outside of your grandfather's clock, use high-quality furniture polish and the best penetration candles available.14 Clean and polish any glass on grandfather clock.
